CryptApps launches the world's most secure password manager - for free!
An Ingenious Breakthrough in Password Security & Management

Fort Myers, Florida, USA – Chances are we all have had one or more online accounts hacked and personal information compromised. Just this past year alone revealed 68 million Dropbox, 117 million LinkedIn, and 500 million Yahoo account credentials were stolen.

Common sense and internet safety protocols suggest users create and use a unique, complex password for each site they log into. Unfortunately, this also makes them virtually impossible for users to remember—and while that very fact has inspired a number of password management software companies, a recent study revealed a key flaw: the top five online password managers had significant vulnerabilities.

The newly launched and patented WordCrypt is the first hack-free method to manage user passwords anonymously, available for free at WordCrypt.com. There's no registration, no login, and no user or password database so it's just not possible for users' passwords or other personal information to be hacked or stolen.

WordCrypt.com offers a WordPress plugin and JavaScript module for developers, as well as a Chrome extension and online password generator for websites that don't yet offer the WordCrypt password option.

The installed module adds a pulsing icon in the password field, as a clickable option rather than typing your password, that launches a secure SSL popup window not visible to the host website.

The way it works is ingeniously simple as illustrated in [this video](). Just type a secret phrase and secret pin number and WordCrypt generates and submits a unique, complex password just for you and that domain. Their algorithm utilizes an irreversible encryption hash function developed by the NSA so that passwords can never be reverse-engineered to reveal the user's secret phrase or number – not even by the developers of WordCrypt.

"Come back in five minutes or five years," says CryptApps founder Jim Lucas, "use your same secret phrase and number, and WordCrypt will generate that same unique, complex password just for you."

Lucas, a former network engineer (CNE, MCSE) living in Florida, was born abroad and raised in Austria, India, Venezuela, Argentina, Denmark, Turkey, China, Canada and the Philippines as the son of an American diplomatic communications officer and career cryptographer. A citizen of the world, his background mimics life online, where users are connected to the international community—continuously surveilled and vulnerable to worldwide threats.

WordCrypt is up and fully functional as CryptApps continues to develop an entire suite of cryptographic programs. "We take internet safety and online privacy very seriously," Lucas says. "Like everybody else, our personal information and private lives depends on it."

CryptApps is seeking to collaborate with a well-established cybersecurity company to help brand and market WordCrypt worldwide.
