The World's <u>First</u> Non-Stored Password Management System
An ingenious breakthrough in password security and management

Naples, Florida – Internet safety protocols and common sense suggest we use a unique, complex password for each site we log into. However, because it's virtually impossible to remember so many different passwords, 83% of us reuse them on multiple sites and 59% of us use the same password on every site! While this problem has inspired a number of browser and password management utilities, recent studies reveal they all have significant vulnerabilities and are frequently targeted by hackers. Essentially, if your passwords are stored anywhere, they are vulnerable.

The recently patented WordCrypt is the world's first non-storing method to easily and securely generate and submit complex, encrypted passwords anonymously. WordCrypt requires no user registration with nothing for users to install on any device and maintains no email or password database so there are no user credentials to hack and steal. In fact, even under subpoena, WordCrypt could not possibly reveal users' identities or their passwords.

WordCrypt.com offers both a WordPress plugin and JavaScript/PHP module prototypes for developers to download and preview. Installing these plugins embeds WordCrypt's 'no-seeing' icon into website login form password fields as a clickable option rather than typing in a password. Selecting the icon launches a secure SSL popup password encryptor that is only visible to the user.

The way it works is ingeniously simple as demonstrated on anysiteyouwant.com.
Users enter their own secret phrase and PIN number and WordCrypt converts those values with the domain name into a unique encrypted password exclusively for that site.

"Come back in five minutes or five years," says WordCrypt founder Jim Lucas, "use your same secret phrase and secret PIN number and WordCrypt will generate that same encrypted password just for you and that domain. We've developed a simpler and much more secure login method that is free for all to use on any device with nothing for users to install."

Lucas, a former computer and network engineer (CNE, MCSE), was born abroad and raised in Austria, India, Venezuela, Argentina, Denmark, Turkey, China, Canada and the Philippines as the son of an American diplomatic communications officer and career cryptographer. A citizen of the world, his background mimics life online where users are connected to the international community—a place where we are all continuously surveilled and vulnerable to worldwide threats that target our personal security and identities.

Passwords have always been the weakest link in Internet safety accounting for more than 80% of identity theft, network breaches and ransomware attacks. WordCrypt secures users' identities, member websites and corporate networks by eliminating the need for users to manage, store or even see any of their passwords. As WordCrypt continues to be developed, Lucas is seeking a cybersecurity company interested in launching this new global standard and ultimately dominating the multi-billion dollar password management market.
