WordCrypt launches the world's first Server-Side Password Manager - for free!

"An Ingenious Breakthrough in Password Security & Management"

Naples, Florida – Common sense and internet safety protocols suggest we use a unique, complex password for each site we log into. Unfortunately, this also makes them virtually impossible to remember—and while that very fact has inspired a number of password management utilities, studies reveal they all have significant vulnerabilities and are frequent targets of hackers.

The newly launched and patented WordCrypt is the world's first server-side method to easily and securely manage complex, encrypted passwords anonymously. WordCrypt requires no user registration or login with nothing for users to install on any device, and maintains no user email or password database so there are no user credentials to hack and steal. In fact, even under subpoena WordCrypt could not possibly reveal users' identities or their passwords.

WordCrypt.com offers JavaScript and WordPress plugins for webmasters to download and install for free on any website. The modules add a pulsing icon in the password field as a clickable option to entering a password. Selecting the icon launches a secure, SSL popup window only visible to the user.

Username or Email

Password

The way it works is ingeniously simple as demonstrated on anysiteyouwant.com. Users create and type their own secret phrase and pin number and WordCrypt converts those values into a unique, encrypted password exclusively for that domain.

"Come back in five minutes or five years," says WordCrypt Founder Jim Lucas, "use the same secret phrase and secret pin number, and WordCrypt will generate that same unique, encrypted password just for you and that domain."

Lucas, a former network tech (CNE, MCSE) living in Naples, Florida, was born abroad and raised in 10 different countries as the son of an American diplomatic officer and career cryptographer. A citizen of the world, his background mimics life online, where users are connected to the international community—continuously surveilled and vulnerable to worldwide threats.

WordCrypt is up and fully functional as Lucas reaches out to cybersecurity and identity protection companies to help further develop and establish WordCrypt as a new global standard for simple and secure online password management.

“We take internet safety and online privacy very seriously,” Lucas says. “Like everybody else, our private lives and personal security depends on it.”
